Selection Structure

if, if..else statement

Programming I (PRG1)

Diploma in Information Technology

Diploma in Financial Informatics

Diploma in Cybersecurity & Digital Forensics

Common ICT Programme

Year 1 (2019/20), Semester 1

Objectives

At the end of this lecture, you will understand

- ❑ **Program Structure**
- ❑ **Flowchart**
- ❑ **Selection Structures**
 - ✓ if Statement (Single-Selection)
 - ✓ if...else Statement (Double-Selection)

The background of the slide is a light gray gradient. On the right side, there is a faint, semi-transparent image of a globe showing the continents. On the left side, there is a faint, semi-transparent image of a computer keyboard, with keys like 'Q', 'W', 'E', 'R', 'T', 'Y', 'U', 'I', 'O', 'P', 'A', 'S', 'D', 'F', 'G', 'H', 'J', 'K', 'L', 'Z', 'X', 'C', 'V', 'B', 'N', 'M', 'Enter', and 'Shift' visible. The title 'Program Structure' is centered in a large, bold, purple font.

Program Structure

Program Structure

- ❑ So far, our statements execute **one after the other** in the order they are written
 - ✓ Sequential Execution / Sequence Structure
- ❑ Statements can be specified such that the next statement to be executed is **not necessarily** the next one in sequence
 - ✓ Transfer of Program Control

Program Structure

An example of sequence structure:

```
# This program calculates the body mass index of a person

#Input values for variables height & weight
height = float(input('Enter your height in m: '))
weight = float(input('Enter your weight in kg: '))

bmi = weight / (height * height)

#Display bmi
print('Your height is ' + str(height) + 'm')
print('Your weight is ' + str(weight) + 'kg')
print('Your bmi is ' + str(bmi))
```

Program Structure

- ❑ There are in general **3 types of control structures** that can be used to control program flow:
 - ✓ **Sequence Structure**
 - ✓ **Selection Structure**
 - ✓ **Repetition Structure**

Flowcharts

- ❑ Recall that we can present our algorithm using pseudocode.
- ❑ An algorithm can also be represented diagrammatically using **Flowcharts**

Flowcharts

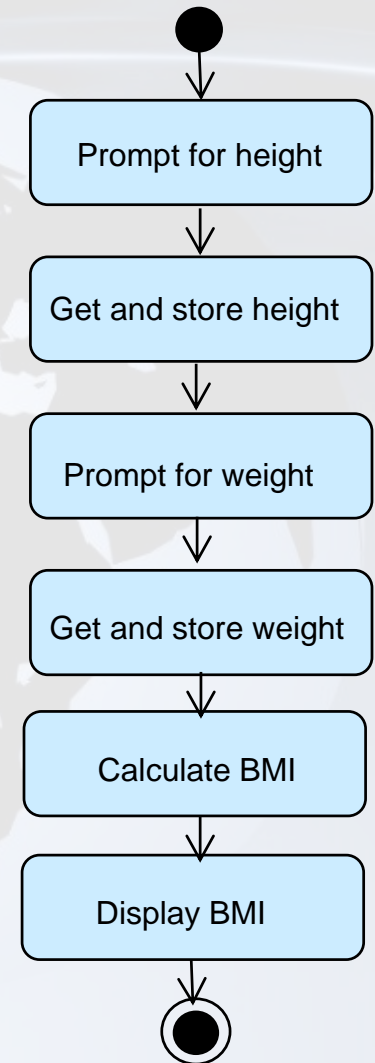

Flowcharts

```
# This program calculates the body mass index of a person

#Input values for variables height & weight
height = float(input('Enter your height in m: '))
weight = float(input('Enter your weight in kg: '))

bmi = weight / (height * height)

#Display bmi
print('Your height is ' + str(height) + 'm')
print('Your weight is ' + str(weight) + 'kg')
print('Your bmi is ' + str(bmi))
```

The background of the slide features a stylized, semi-transparent globe centered on the right side, showing the continents of Africa and Europe. To the left of the globe, there is a faint, perspective-distorted image of a computer keyboard, with keys like 'Q', 'W', 'E', 'R', 'T', 'Y', 'U', 'I', 'O', 'P', 'A', 'S', 'D', 'F', 'G', 'H', 'J', 'K', 'L', 'Z', 'X', 'C', 'V', 'B', 'N', 'M', and 'Enter' visible. The entire background is a light beige color, and the title text is overlaid in the center.

Selection Structures

Selection Structures

- ❑ **Selection** structures/statements allow selection among **alternative courses** of action.

- ❑ **3 types of selection statements:**

- ✓ **if** -- **Single-Selection** statement
- ✓ **if...else** -- **Double-Selection** statement
- ✓ **if...elif...else** -- **Multiway-Selection** statement

if Single-Selection Statement

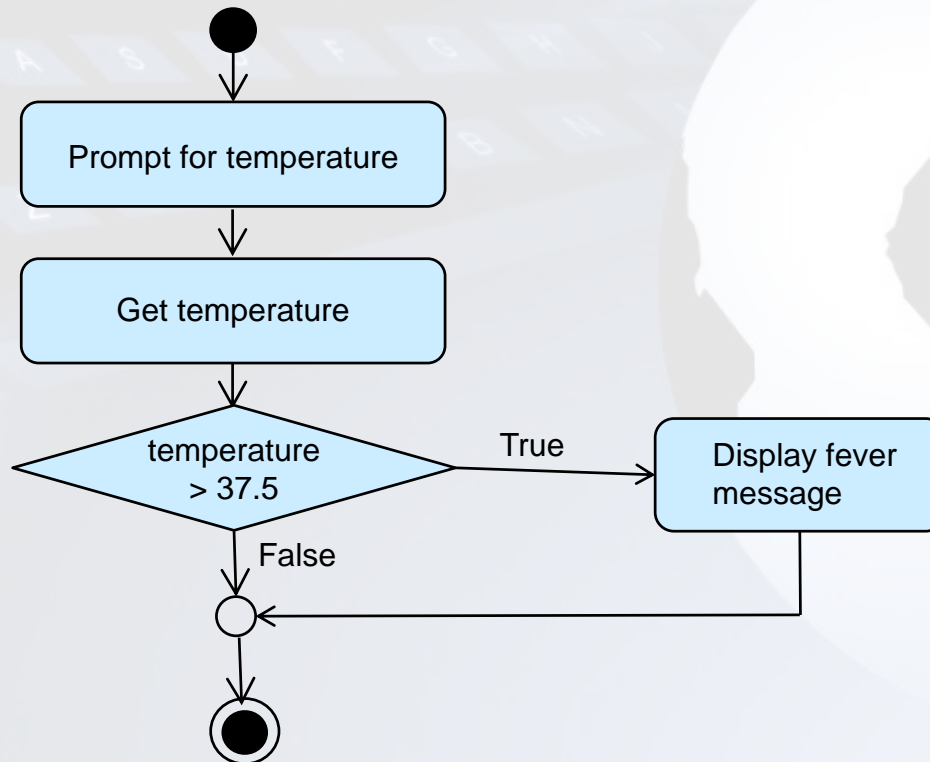

- ❑ Either **selects or ignores the action** depending on the decision made
- ❑ **Condition** evaluates to boolean **true or false**
- ❑ **General format:**

***if condition:
true_statement***

Example

Tom is said to have a fever when his temperature is higher than 37.5 °C.

if Single-Selection Statement

- ❑ The algorithm may be written in the following code:

```
IF temperature > 37.5 THEN  
    display "Tom is having a fever"  
ENDIF
```

A condition

```
if temperature > 37.5:  
    print('Tom is having a fever of {} deg C.'.format(temperature))
```

if Single-Selection Statement

Practical Note:

- ❑ At the **interactive prompt**, be sure to terminate multiline compound statements(e.g. if tests or loops) with a **blank line**, i.e. by **pressing Enter key twice** to make it run.

```
>>> temperature = 38
>>> if temperature > 37.5:
    print('Tom is having a fever of {:.1f}'.format(temperature))

Tom is having a fever of 38.0
```

- ❑ This is **not required in the script file**.
 - ✓ Blank lines are simply ignored when present.
 - ✓ Thus pasting code from script file into interactive prompt may not work, unless code includes the blank lines.

if Statement – a block

- ❑ If there is **more than one statement** to execute when the condition is true,
 - ✓ *must* consistently **indent** the statements.
- ❑ A set of statements that follow the same physical indentation is called a **block**.

```
if condition:  
    true_statement_1  
    true_statement_2  
    :  
    true_statement_n
```

```
if temperature > 37.5:  
    print('Tom is having a fever.')    print('He should drink more water ')  
    print('and take more rest.')
```

Conditions

❑ Recall:

- ✓ Conditions are boolean expressions that evaluate to **True** / **False**. e.g. `temperature > 37.5`
- ✓ Relational operators are used.

Relational Operator	Meaning	Example of Condition	Meaning
<code><</code>	Less than	<code>x < y</code>	x is less than y
<code>></code>	Greater than	<code>x > y</code>	x is greater than y
<code>==</code>	Equal to	<code>x == y</code>	x is equal to y
<code><=</code>	Less than or equal to	<code>x <= y</code>	x is less than or equal to y
<code>>=</code>	Greater than or equal to	<code>x >= y</code>	x is greater than or equal to y
<code>!=</code>	Not equal to	<code>x != y</code>	x is not equal to y

The background of the slide is a light gray gradient. On the right side, there is a faint, semi-transparent image of a globe showing the continents. On the left side, there is a faint, semi-transparent image of a computer keyboard, with keys like 'Q', 'W', 'E', 'R', 'T', 'Y', 'U', 'I', 'O', 'P', 'A', 'S', 'D', 'F', 'G', 'H', 'J', 'K', 'L', 'Z', 'X', 'C', 'V', 'B', 'N', 'M', and 'Enter' visible.

if...else Double-Selection

if...else Double-Selection Statement

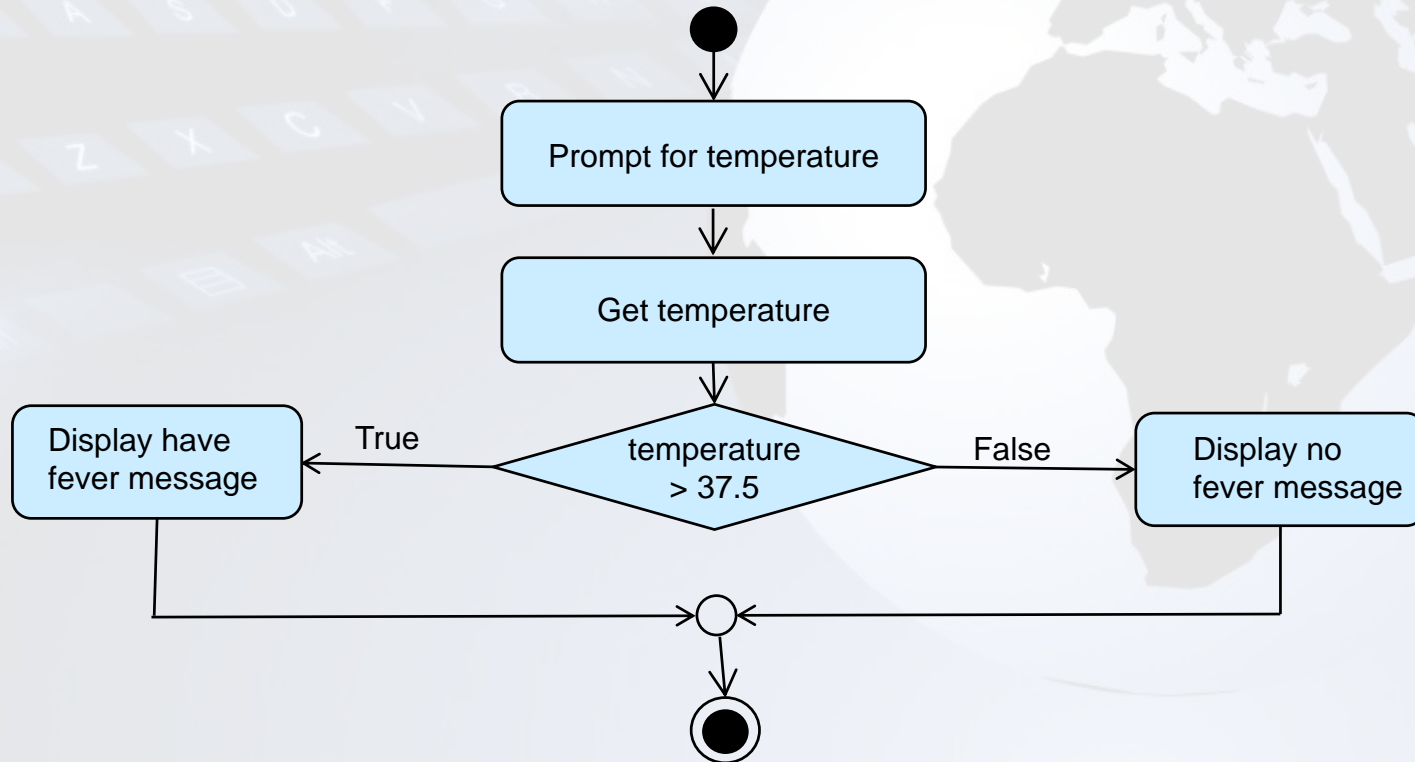

- ❑ Select from 2 different actions depending on the condition
- ❑ General format:

if **condition**:
 true_statement
else:
 false_statement

Example

Tom is said to have a fever when his temperature is higher than 37.5 °C otherwise he is not.

if...else Double-Selection Statement

Tom is said to have a fever when his temperature is higher than 37.5 °C otherwise he is not.

Pseudocode:

```
IF temperature is greater than 37.5 THEN  
    display “Tom is having a fever.”  
ELSE  
    display “Tom is not having a fever.”  
ENDIF
```

if...else Double-Selection Statement

Pseudocode:

```
IF temperature is greater than 37.5 THEN
    display "Tom is having a fever."
    display "He should have more rest."
ELSE
    display "Tom is not having a fever."
    display "He can perform his normal duties."
ENDIF
```

Python code:

```
if temperature > 37.5:
    print('Tom is having a fever of {} deg C. '.format(temperature))
    print('He should have more rest. ')
else:
    print('Tom is not having a fever.')
    print('He can perform his normal duties.')
```

Activity 1 – CalComm.py

- ❑ ABC Company pays its sales agents on a commission basis. Each agent is paid 10% commission for monthly sales above or equal to \$10,000 and 5% commission for monthly sales below \$10,000.
- ❑ Write a program to accept the monthly sales of a particular agent and based on the amount, determine and print out the commission earned.

```
Enter monthly sales of sales agent: 12000  
The commission rate is : 10%  
The commission paid is : $1200.00
```

```
Enter monthly sales of sales agent: 8000  
The commission rate is : 5%  
The commission paid is : $400.00
```

Activity 2 – NumGenerator.py

- ❑ Write a program that generates two integers between 0 and 100 inclusive and prompts the user to enter the sum of these 2 integers. The program reports if the answer is correct or wrong (program will also print the correct answer if the user answer is wrong).
- ❑ Hint: you need to use the **random** module
 - ✓ i.e. `import random`
`num1 = random.randint(0,100)`

```
>>>
Enter the sum of 72 and 12: 84
Your answer is correct!
>>> ===== RESTART =====
>>>
Enter the sum of 83 and 6: 141|
Your answer is wrong.
The correct answer is 89.
```

Summary

- ❑ **There are 3 types of Control structure in a program:**
 - ✓ Sequence, Selection and Repetition structures
- ❑ **Flowchart**
- ❑ **Selection Structure**
 - ✓ The if Single-Selection Statement executes a course of action(s) or ignores it depending evaluation of condition.
 - ✓ The if...else Double-Selection Statement executes a course of action(s) if condition evaluates to true, and another course of action(s) if condition is false.
