Operators and Interactivity

Programming I (PRG1)

Diploma in Information Technology

Diploma in Financial Informatics

Diploma in Cybersecurity & Digital Forensics

Common ICT Programme

Year 1 (2019/20), Semester 1

Objectives

At the end of this lecture, you will learn about....

- ❑ **Strings**
- ❑ **Operators**
- ❑ **Program Interactivity**
- ❑ **Math Function**

The background of the slide features a stylized, light-colored globe centered on the right side. To the left of the globe, a computer keyboard is visible, with keys like 'Q', 'W', 'E', 'R', 'T', 'Y', 'U', 'I', 'O', 'P', 'A', 'S', 'D', 'F', 'G', 'H', 'J', 'K', 'L', 'Z', 'X', 'C', 'V', 'B', 'N', 'M', and 'Enter' clearly visible. The entire scene is set against a light blue and white gradient background.

Strings

Strings

- ❑ Strings in Python can be enclosed in either single quotes ('') or double quotes ("), or three of each (''' or ''')

```
>>> type('Welcome to ICT')
<class 'str'>
>>> type("Welcome to ICT")
<class 'str'>
>>> type("""Welcome to ICT""")
<class 'str'>
>>> type(''Welcome to ICT'')
<class 'str'>
```

Strings

- ❑ Triple quoted strings can even span multiple lines:

```
>>> message="""Welcome to ICT
,hope you will enjoy
Python"""
>>> print(message)
Welcome to ICT
,hope you will enjoy
Python
>>>
```

```
>>> print("""Welcome to ICT
,hope you will enjoy
Python""")
Welcome to ICT
,hope you will enjoy
Python
```

What is the expected output?

```
>>>
>>> print('Welcome to ICT's graduation night! ')
```

The background of the slide features a stylized, semi-transparent globe centered on the right side, showing the continents of Africa and Europe. To the left of the globe, a computer keyboard is visible, with keys like 'Q', 'W', 'E', 'R', 'T', 'Y', 'U', 'I', 'O', 'P', 'A', 'S', 'D', 'F', 'G', 'H', 'J', 'K', 'L', 'Z', 'X', 'C', 'V', 'B', 'N', 'M', and 'Enter' clearly visible. The entire background has a light blue and white color scheme with a subtle grid pattern.

Operators

Operators

- ❑ **Operators are symbols in programming languages to perform processing actions**
 - ✓ Arithmetic Operators
 - ✓ Assignment Operators
 - ✓ Relational Operators – Conditional Operators
 - ✓ Logical Operators – Conditional Operators

Arithmetic Operators

Operators		Example	Given $y=5; z=3$
+	addition	$x = y + z$	$x = 8$
-	subtraction	$x = y - z$	$x = 2$
*	multiplication	$x = y * z$	$x = 15$
/	division	$x = y / z$	$x = 1.6666666666666667$
%	modulus/remainder	$x = y \% z$	$x = 2$
//	floor division	$x = y // z$	$x = 1$
**	exponentiation	$x = y ** z$	$x = 125$

Order of Arithmetic Operators

- ❑ When more than one operator appears in an expression, the order of evaluation depends on the rules of precedence.
- ❑ Order of precedence (highest to lowest) is:

Operator	Description	
()	Parentheses (grouping)	
**	Exponentiation (raise to a power)	<i>right to left</i>
* / // %	Multiplication, division, floor division, modulus	<i>left to right</i>
+ -	Addition, subtraction	<i>left to right</i>
=	Assignment	

Activity 1

- ❑ In what order would you solve this mathematical equation?

$$E_{wg} = 6.112 \times e^{(17.67 \times T_w) / (T_w + 243.5)}$$

Where,

T_w = Wet Bulb Temperature

e = Vapor Pressure

Mathematical Formulae to Python

	Mathematical Formulae	Python Statement
1.	$y = ax + b$	
2.	$y = (a + b) (a - b)$	
3.	$y = 2[(a + b) (a - b)] - x$	
4.	$y = 1 - \frac{2a}{3b}$	
5.	$a = -b$	

Assignment Operator =

- ❑ Assigns value to variable
- ❑ Assignment is from **right to left**
 - ✓ E.g. What is the value of **k** after each line?
k = 6
k = k + 1
 - adds 1 to value of variable **k**
 - assigns new value back to the variable **k**

Assignment Statements

□ Simple Assignment

<variable> = <expr>

- ✓ *variable* is an identifier, *expr* is an expression
- ✓ The expression on the RHS is evaluated to produce a value which is then associated with the variable named on the LHS.

```
x = 3.9 * y * (1-z)
```

```
fahrenheit = 9/5 * celsius + 32
```

```
x = 5
```

Assignment Statements

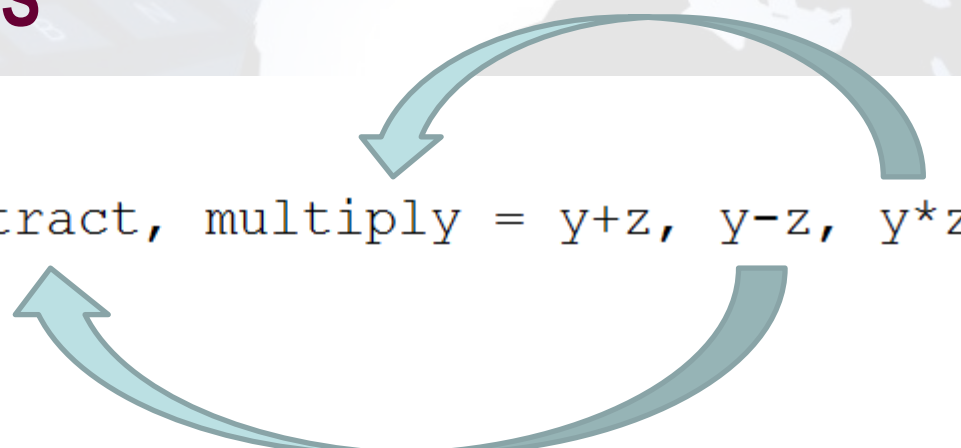

- ❑ Variables can be reassigned as many times as you need during the execution of your program!

```
>>> class_size=0
>>> class_size
0
>>> class_size=18
>>> class_size
18
>>> class_size = class_size + 1
>>> class_size
19
>>> print("The class size is", class_size)
The class size is 19
```

Simultaneous Assignment

- ❑ Several values can be calculated at the same time
<var>, <var>, ... = <expr>, <expr>, ...
- ❑ Evaluate the expressions in the RHS and assign them to the variables on the LHS

```
>>> y = 5
>>> z = 3
>>> add, subtract, multiply = y+z, y-z, y*z
>>> add
8
>>> subtract
2
>>> multiply
15
```

The diagram illustrates the execution of simultaneous assignment. A large blue arrow points from the right-hand side (RHS) of the assignment statement `add, subtract, multiply = y+z, y-z, y*z` to the variable `add` in the subsequent line. Another large blue arrow points from the same RHS to the variable `multiply` in the subsequent line. This indicates that the expressions on the RHS are evaluated first, and their results are then assigned to the variables on the LHS.

Activity 2

- ❑ Given $\text{num1} = 5$, $\text{num2} = 3$, how would you swap the values in num1 and num2 ?

Relational Operators

- ❑ *Relational operators compares the two operands and produce a Boolean value of either **True** or **False**.*

Operator	Description
==	equal
!=	not equal
>	greater than
>=	greater than or equal
<	less than
<=	less than or equal

Activity 3

- ❑ Assume $x = 4$, $y = 3$, $z = 2$, evaluate the following expression

Boolean Expression	Result
$x < y + z$	
$y == 2 * x + 3$	
$z <= x - y$	
$z > x \% z$	
$x != y$	

Logical Operators

- ❑ **Logical operators allow us to build more complex Boolean expressions from simpler Boolean expressions.**

Logical Operator	Description
and	produces True only if both Boolean expressions are true
or	produces True if either of the Boolean expressions is true
not	Negates a Boolean value

Operators - Example

□ Assume $x = 1$, $y = 4$, $z = 14$

Boolean Expression	Result
$x \leq 1$ and $y == 3$	
$x \leq 1$ or $y == 3$	
not ($x > 1$)	
not $x > 1$	
not ($x \leq 1$ or $y == 3$)	
$x \leq 1$ or $y > 1$ and $z < 1$	
$(x \leq 1$ or $y > 1)$ and $z < 1$	

Order of Operators

Operator Precedence, from highest to lowest:

Operator	Description	
()	Parentheses (grouping)	
**	Exponentiation (raise to a power)	<i>right to left</i>
* / // %	Multiplication, division, floor division, modulus	<i>left to right</i>
+ -	Addition, subtraction	<i>left to right</i>
<, <=, >, >=, !=, ==	Relational operators	
not x	Boolean NOT	
and	Boolean AND	
or	Boolean OR	

Type conversion

- ❑ `int()`, `float()`, `str()`, and `bool()` convert to integer, floating point, string, and boolean (True or False) types, respectively

Example	Output
<code>print (4.0 / 2.0)</code>	
<code>print (int(4) / int(2))</code>	
<code>print (float(4) / float(2))</code>	
<code>print (int (3.1415926))</code>	
<code>print (str(3.1415926))</code>	
<code>print(bool(1))</code>	
<code>print(bool(0))</code>	

Activity 4

- Given the following algebraic expressions, write the equivalent Python expression.

Algebraic Expression	Python Expression
$y = ax^2 + bx + c$	
$y = \frac{ax^3 + bx^2 + cx}{4}$	
$p = \frac{1}{3} + rs - uv$	
$s = \frac{4}{3(r + 34)} - 9(a + bc) + \frac{3 + d}{a + bd}$	

The background of the slide features a stylized, light-colored globe centered on the right side. To the left of the globe, there is a faint, perspective-distorted image of a computer keyboard, with keys like 'Q', 'W', 'E', 'R', 'T', 'Y', 'U', 'I', 'O', 'P', 'A', 'S', 'D', 'F', 'G', 'H', 'J', 'K', 'L', 'Z', 'X', 'C', 'V', 'B', 'N', 'M', and 'Enter' visible. The entire background is set against a light blue and white gradient.

Program Interactivity

Program Interactivity

<variable> = input(<prompt>)

- ❑ Built-in function in Python for getting input from user and store it into a variable.

```
>>> name = input("Enter your name: ")
Enter your name: Joel
>>> name
'Joel'
```

- ✓ First the prompt is printed
- ✓ The input part waits for the user to enter a value and press <enter>
- ✓ The expression that was entered is captured as a string of characters and is assigned to the variable.

Assigning Input

- ❑ You need to convert the string to int or float in order to use the numeric value.

```
>>> height = int(input("Enter your height in cm: "))
Enter your height in cm: 179
>>> height
179
```

```
>>> weight = float(input("Enter your weight in kg: "))
Enter your weight in kg: 55.8
>>> weight
55.8
```

Example – CalBMI.py (assign inputs)

```
# This program calculates the body mass index of a person

#Input values for variables height & weight
height = float(input('Enter your height in m: '))
weight = float(input('Enter your weight in kg: '))

bmi = weight / (height * height)

#Display bmi
print('Your height is ' + str(height) + 'm')
print('Your weight is ' + str(weight) + 'kg')
print('Your bmi is ' + str(bmi))
```

Output

```
Enter your height in m: 1.73
Enter your weight in kg: 60
Your height is 1.73m
Your weight is 60.0kg
Your bmi is 20.04744562130375
```

```
Enter your height in m: 1.45
Enter your weight in kg: 60
Your height is 1.45m
Your weight is 60.0kg
Your bmi is 28.53745541022592
```

The background of the slide features a stylized, light-colored globe centered on the right side. To the left of the globe, a computer keyboard is visible, with keys like 'Q', 'W', 'E', 'R', 'T', 'Y', 'U', 'I', 'O', 'P', 'A', 'S', 'D', 'F', 'G', 'H', 'J', 'K', 'L', 'Z', 'X', 'C', 'V', 'B', 'N', and 'M' clearly visible. The entire background is set against a light blue and white gradient.

Math Functions

Math Functions

- ❑ Python comes with a large number of *modules* of its own which have functions for different purposes
- ❑ Most common module is **math** that has mathematical functions for computation.
 - ✓ Usage: **import math**

```
>>> import math  
>>> math.sqrt(5)  
2.23606797749979
```

```
>>> math.pi  
3.141592653589793
```

```
>>> math.pow(2,2)  
4.0
```

Math Functions

Math function	Description
<code>factorial(x)</code>	Returns the factorial of x
<code>ceil(x)</code>	Returns the smallest integer greater than or equal to x.
<code>exp(x)</code>	Returns e^{**x}
<code>pow(x, y)</code>	Returns x raised to the power y
<code>sqrt(x)</code>	Returns the square root of x
<code>trunc(x)</code>	Returns the truncated integer value of x
<code>pi</code>	Mathematical constant, the ratio of circumference of a circle to it's diameter (3.14159...)
<code>e</code>	mathematical constant e (2.71828...)

Refer to: <https://docs.python.org/3/library/math.html> for other math functions

Activity 5

Write a program that inputs the radius and height values of a cylinder and displays the surface area of the cylinder.

$$A = 2\pi r h + 2\pi r^2$$

Activity 6

Write a program that accepts the time in seconds as input and converts it into hours, minutes and seconds.

```
Please enter the time to be converted, in sec: 8600  
Time: 2 hr, 23 min 20 sec
```
