Lists

Programming I (PRG1)

Diploma in Information Technology

Diploma in Financial Informatics

Diploma in Cybersecurity & Digital Forensics

Year 1 (2019/20), Semester 1

Objectives

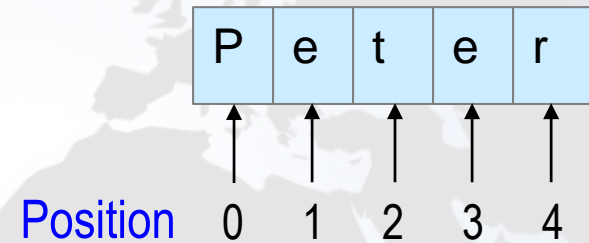

At the end of this lecture, you will learn how to:

- ☐ **Create Lists**
- ☐ **Process Lists using List operators and methods**

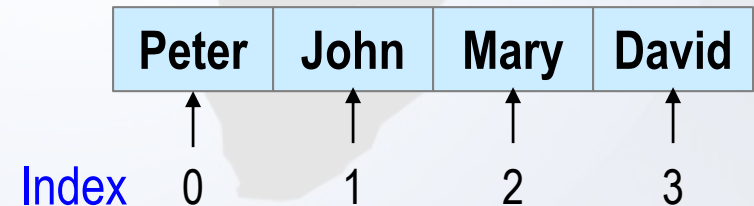

What is List

- ❑ A **list** is considered a sequence type in Python, similar to Strings.
- ❑ A list is a sequence of values.
 - ✓ In a string, the values are characters.
 - ✓ In a list, the values can be any type.
- ❑ Values in a list are called **elements** or **items**.

string friend

list friends

Examples of List

- ✓ Names of your friends
- ✓ List of students' marks
- ✓ Shopping list
- ✓ Recipe – a list of instructions
- ✓ Text document – a list of lines

| | |
|---------|------|
| Peter | 84.7 |
| David | 71 |
| Vincent | 55 |
| Hafiz | 80 |
| Janet | 63 |
| Albert | |
| | |

S9099885K;Ang PS;98765432

S9177885P;David Davis;89778899

S9267890A;Lim Vincent;91990099

S9111199Q;Tan SS;88995566

....

Creating a List

- ❑ Enclose the elements in square brackets, separate each element by commas.

E.g. []
 ['Peter', 'John', 'Mary', 'David']
 [89, 77, 55, 69]

- ❑ Usually we assign the list to a variable name so that we can refer to the list subsequently:

E.g. emptyList = []
 friendsList = ['Peter', 'John', 'Mary', 'David']
 marksList = [89, 77, 55, 69]

Creating a List

- ❑ An element in a list can be another list – *nested list*.

E.g. `friendsList = ['Peter', ['John', 'Mary'], 'David']`

`matrix = [[1,2,3], [4,5,6], [7,8,9]]`

- ❑ A list that contains no elements is called an empty list.

E.g. `emptyList = []`

- ❑ A list may contain elements of different types.

E.g. `mixedList = ['Peter', 100, 23.5, [10, 20]]`

Basic Operators for List

- ✓ Use the **bracket operator [n]** to access an element in the list.
- ✓ Use the **[n:m] operator** to access part of the list from index n to m.
 - Usage is similar to Strings

```
>>> list1 = [1,2,3,4,5]
>>> list1
[1, 2, 3, 4, 5]
```

```
>>> list1[0]
1
>>> list1[1]
2
>>> list1[-1]
5
```

```
>>> list1[1:3]
[2, 3]
>>> list1[3:]
[4, 5]
>>> list1[:3]
[1, 2, 3]
```

```
>>> friends = ['Peter', 'John', 'Mary', 'David']
>>> friends[1:3]
['John', 'Mary']
```

Basic Operators for List

- ✓ **+** operator concatenates lists.
- ✓ **in** operator detects the presence of an element in the list.
- ✓ **==** operator compares the equality of two lists

```
>>> list1 = [1,2,3,4,5]
>>> list2 = ['a','b','c']
>>> list1 + list2
[1, 2, 3, 4, 5, 'a', 'b', 'c']
```

```
>>> 1 in list1
True
>>> 1 in list2
False
```

```
>>> list3 = [1,2,3,4,5]
>>> list1 == list2
False
>>> list1 == list3
True
```

Basic Functions for List

✓ function **len()** returns the number of elements in the list.

```
>>> list1 = [1,2,3,4,5]
>>> len(list1)
5
```

✓ function **min()** returns the smallest element in the list.

```
>>> min(list1)
1
```

✓ function **max()** returns the largest element in the list.

```
>>> max(list1)
5
```

Activity 1 – ProcessMarks.py

- ✓ Create a list called **marksList** that contains 10 elements.
- ✓ Display the value in the first element of **marksList**.
- ✓ Add the values in the last two elements of **marksList** and assign the result to the variable **sum**.
- ✓ Double the value in the second element of **marksList**.

**Sample
output**

```
marksList [89, 77, 55, 69, 50, 60, 11, 10, 14, 20]  
The 1st element is 89  
The sum of last 2 elements is 34  
Double value of 2nd element is 154
```

Built-in List methods

| Methods | Description | Example |
|--------------------------|--|--|
| | | <code>letters=['a','b']</code> |
| <code>append(x)</code> | Add an element, x , to the end of the list. | <code>letters.append('c')</code> <code>letters</code> <code>['a', 'b', 'c']</code> |
| <code>extend(L)</code> | Extend list by appending all the items in the given list L. | <code>letters.extend(letters)</code> <code>letters</code> <code>['a', 'b', 'c', 'a', 'b', 'c']</code> |
| <code>insert(i,x)</code> | Insert an item, x , before the given position i in the list. | <code>letters.insert(3,'z')</code> <code>letters</code> <code>['a', 'b', 'c', 'z', 'a', 'b', 'c']</code> |

Built-in List methods

| Methods | Description | Example |
|------------------------|---|---|
| | | letters is the list <code>['a', 'b', 'c', 'z', 'a', 'b', 'c']</code> |
| <code>remove(x)</code> | <p>Remove the first item from the list whose value is x.</p> <p>Error occurs if x is not in the list.</p> | <p><code>letters.remove('c')</code> letters <code>['a', 'b', 'z', 'a', 'b', 'c']</code></p> <p><code>letters.remove('d')</code> ValueError: list.remove(x): x not in list</p> |
| <code>pop([i])</code> | <p>Remove the item at the given position in the list and return it.</p> <p>Removes and returns the last item in the list if the argument is not stated.</p> | <p><code>letters.pop(2) → 'z'</code> letters <code>['a', 'b', 'a', 'b', 'c']</code></p> <p><code>letters.pop() → 'c'</code> letters <code>['a', 'b', 'a', 'b']</code></p> |

Built-in List methods

| Methods | Description | Example |
|------------------------|--|---|
| | | Letters is the list <code>['a', 'b', 'a', 'b']</code> |
| <code>index(x)</code> | Return the index in the list of the first item whose value is x . Error occurs if x is not in the list. | <code>letters.index('a') → 0</code> <code>letters.index('c')</code> ValueError: 'c' is not in list |
| <code>count(x)</code> | Return the number of times x appears in the list. | <code>letters.count('a') → 2</code> |
| <code>reverse()</code> | Reverse the elements of the list in place. | <code>letters.reverse()</code> <code>letters</code> <code>['b', 'a', 'b', 'a']</code> |
| <code>sort()</code> | Sort the items of the list in place. | <code>letters.sort()</code> <code>letters</code> <code>['a', 'a', 'b', 'b']</code> |
| <code>clear()</code> | Remove all items from the list. | <code>letters.clear()</code> |

Activity 2

❑ Given that the list *firstList* and *secondList* are created as follows:

✓ *firstList* = [2, 4, 6, 8, 10]

✓ *secondList* = [2, 4, 6, 8, 10]

Evaluate the output in the following pages.

Evaluate

```
firstList = [ 2, 4, 6, 8, 10]  
secondList = [ 2, 4, 6, 8, 10 ]
```

| Program Text | Output |
|------------------------------------|--------|
| <code>print(firstList[1])</code> | |
| <code>print(firstList[-1])</code> | |
| <code>print(firstList[5])</code> | |
| <code>print(firstList[1:3])</code> | |
| <code>print(firstList[:3])</code> | |
| <code>print(firstList[3:])</code> | |
| <code>print(firstList)</code> | |

Evaluate

```
firstList = [ 2, 4, 6, 8, 10]  
secondList = [ 2, 4, 6, 8, 10 ]
```

| Program Text | Output |
|--|--------|
| <code>print(len(firstList))</code> | |
| <code>print(secondList)</code> | |
| <code>print(firstList == secondList)</code> | |
| <code>thirdList = firstList + secondList</code> <code>print(thirdList)</code> | |
| <code>print(5 in firstList)</code> <code>print(5 not in secondList)</code> | |

Activity 3 – SearchName.py

❑ Write a Python program to

- ✓ Declare a list of strings **nameList** and initialize with the following string elements "Tom", "Joe", "Mary", "John", "Bob", "Jane"
- ✓ Prompt user to input the name to search and check if the name exists in the list **nameList**
- ✓ Display the index of the name list

```
Enter name to search : John  
Name John is found in position 3 in the name list.  
>>>
```
